

PDF Processing Guide

This sample PDF demonstrates local indexing with docs2vecs.

The indexer scans PDF files, reads text, splits content into chunks, generates local embeddings, and stores vectors in ChromaDB.

Processing steps:

1. Scan the input directory for PDF files.
2. Extract text from the PDF document.
3. Split the text into chunks.
4. Generate embeddings locally.
5. Store the result in the sample ChromaDB collection.
